

Course – FDMEE: Administrator

Duration	Cost	Prerequisites
2 Days	£1,600	None

Course Description

The FDMEE course is designed to take you through the typical steps needed in an implementation of Oracle Hyperion Financial Data Quality Management Enterprise Edition (FDMEE). You will develop and deploy FDMEE as an interactive case study throughout the course.

The course begins with a general overview of FDMEE and how it fits into the Oracle EPM suite of products. The class then begins with the settings sources and targets, categories, and periods. Various system and application level settings are introduced.

Next the focus shifts to setting up FDMEE to load data. Exercises are performed with a flat file with discussion of your application to ERP and database sources as well. Import formats and locations are created, with an introduction to Jython import scripting. Member mappings, including conditional script mappings, and load rules are covered before executing the load to the target system.

Next we shift to ancillary topics, such as batch processing, multiperiod loads, and journals. The class ends with security and reporting.

Course Content

- Overview of FDMEE
- Source, Target, and System Settings
- Import Formats and Locations
- Mapping
- Validation Rules
- Security
- Reporting
- Journals
- Batch Processing
- Multiperiod Load

Course Outcomes

- Navigate within FDMEE
- Set up import formulas
- Build mapping tables
- Load and consolidate data from FDMEE in the target system
- Set up and maintain security
- Additional tasks such as batch loading and journals
